                                                                                                                                        The invention relates to an alpha2-antiplasmin cleaving enzyme comprising a protein having a molecular weight of 180 kD in a dimeric form as determined by SDS-PAGE, where each subunit of the dimeric form has a molecular weight of 97 kD as determined by SDS-PAGE, and where the enzyme cleaves precursor alpha2-antiplasmin at the Pro12-Asn13 bond. The enzyme inhibitors of the enzyme and methods for detecting such inhibitors are useful for treating conditions involving fibrin, e.g. inflammatory conditions such as all forms of arthritis, organ fibrosis, undesirable scarring, cancer or its metastases; or atherothrombotic disease such as acconnary artery thrombosis, stroke, pulmonary embolism, all other forms of arterial and venous thromboses. This peptide is an internal sequence of the alpha2-antiplasmin cleaving enzyme corresponding to amino acids
                                                                     ywe, useful for treating conditions conditions such all forms of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide #3924 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                Gaps

The single exon nucleic acid probes may be used for predicting measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form
                                                                                                                                                                              (SENP: see AAI10068-AAI20459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notcably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               genome-derived single exon nucleic acid probes useful for analyzing
Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                 probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                              present invention relates to human single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide #4017 encoded by human foetal liver single exon probe.

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human genome derived single exon nucleic acid probes useful for analyzing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver. Comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis. Chyperlipoproctineemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. AB647348-AB655930 represent human liver single exon encoded peptides of the invention. Note: The sequence cirromation for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                 Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 65; DB 4; Length 51;

The invention relates to a spatially-addressable set of single exon

Claim 27; SEQ ID NO 28959; 634pp; English.

```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid sequences mentioned in the specification, or their complements or the 1237 open reading frames derived from the 12614 and compressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung comprising the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridiation of detectably clabeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included comprising (a) in the above mentioned microarray; assigning exons in several comprising (a) dentifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in the above with the exons, where a common pattern of expression of the exons in the tissues and/or cell types using hybridisation to a single exon comprising one of 12011 sequences, mentioned in the specification, or encoded by the corpsession of the exons in the tissues and/or cell types using hybridisation to a single comprising one of 12011 sequences, mentioned in the specification, or encoded by the corpsession of extremely frames (ORP). The probes are used for gene expression classes (ILD), familial idiopathic pulmonary fibrosis, pulmonary incodes each or pulmonary encodes each or pulmonary encodes each exonic pulminary encodes each exoni
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present sequence is a peptide/protein encoded by a single exon probe of
the invention. Note: The sequence data for this patent did not form part
of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphanapioleiomyomicosis, pulmonary alveolar proceinosis, Karagener syndrome, fibrocyseic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide equences in the specification, or their complements or fragments, and equences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids sequences concoling at least 8 amino acids of any of the 6888 amino acids dequences of concoling at least 8 amino acids of any of the 6888 amino acids mander high stringency conditions to a nucleic acid molecule expression (comprising a plurality of single exon nucleic acid probes for measuring human gene expression, a method of probe cited above, where each of the plurality of probes is separately can addressably stolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a vector comprising the single exon probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid acuted antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to measure gene expression, an achod of providing human gene expression date by subscription, and a computer-readable corrage methods of selling data by subscription, and a computer-readable corrage methods including data by subscription, and a computer-readable corrage methods including data by subscription, and a computer of the probes may be used as tools for surveying the expression analysis. The probes may be used as tools for surveying the probes of expression analysis. The probes may be used as tools for surveying the subscription in the probes are used in identifying and characterising grantler genomic alterations in the probes are used in identifying and characterising grantler genomic alterations. In the probes of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.
                                                                                                                                                                                           Human, gene expression, single exon probe, microarray, alternative splicing event, genomic alteration.
                                                                                                                                              Human genome derived single exon protein #1892.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 45; SEQ ID NO 29292; 80pp; English.

Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme comprising an amino acid substitution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Down-regulating an immune response comprises administering to a subject
in need a fibroblast activation protein (FAP) alpha dimer enzyme in an
amount effective to down-regulate an immune response.
                                                                                                                                                                               Gape
                                                                                                                                                                               ö

of A657D; and a composition comprising a FAP alpha dimer enzyme lacking amino acids 269-448 from mouse FAP.

The method further comprises administering to the subject a second agent. The second agent is an anti-inflammatory agent, immunosuppressant, or anti-mycobacterial agent. The FAP alpha dimer enzyme is antibacterial, antiviral, antifungal, anti-parallel type FAP alpha dimer enzyme. The FAP alpha dimer enzyme is a truncation mutant. The FAP alpha dimer enzyme is a heteroidimer of a FAP alpha momer and a pPPIV/CD26 monomer. The FAP alpha dimer or symme is a heteroidimer of a FAP alpha monomer and a pPPIV/CD26 monomer. The FAP alpha dimer or acid substitution is present in the beta-propeller domain, the caralytic substitution is present in the beta-propeller domain, the caralytic condition, abnormal immune response selected from inflammation.

Condition, abnormal immune response selected from inflammation, continued disease, sepsis, graft versus host disease, transplant rejection, toxic shock syndrome, The approximate in mune entry allergy, asthma, atherosclerosis, contenting and allergy, asthma, atherosclerosis, contenting the parallel allergy, asthma, atherosclerosis, contenting and allergy and psy inferring the contenting and allergy asthma, atherosclerosis, contents and allergy and psy inferring the contents and allergy. autoimmune disease is selected from c, autoimmune thyroiditis, systemic lupus erythematosus (SLE), uveitis, hemolytic anemias, rheumatic fever, Crohn's disease, Guillain-Barre's syndrome, psoriasis, Graves' disease, myasthenia gravis, glomerulonephritis, autoimmune hepatitis and multiple sclerosis. The subject does not have cancer or a predisposition to cancer. The present sequence represents the amino acid sequence of human soluble fibroblast activation protein (FAP) alpha dimer (corresponding to AEB94159 minus N-terminal amino acids 1-37). response is subsequent to an infection, such as an RSV infection. The 8X99999999999999999999999999

comportaing a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme acking an enino acids 269-448 and comprising amino acids 269-448 from mouse FAP. The method further comprising amino acids 269-448 from mouse FAP. The method further comprising amino acids 269-448 from mouse FAP. The second agent is an anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibacterial, antifungal, anti-carrier agent such as antibacterial, antiviral, antifungal, anti-carrier agent such as antibacterial antiviral, antifungal, anti-carrier and anti-carrier and anti-carrier and an anti-carrier and an anti-carrier and an antibacterial agent. The FAP alpha dimer enzyme is a heterodimer of a PAP alpha monomer and a DPPIV/CD26 monomer. The FAP alpha dimer enzyme is a heterodimer of a PAP alpha monomer and a DPPIV/CD26 monomer. The FAP alpha dimer enzyme is a heterodimer of a DPPIV/CD26 monomer. The FAP alpha dimer enzyme comprises an amino acid substitution relative to wild type FAP alpha dimer. The mediated comman, or an N-linked glycosylation site and alters disulfide bond containing the munne response is an especially an IL-I mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Crohn's disease, Guillain-Barre's syndrome, psoriasis, Graves' disease, myasthenia gravis, glomerulonephritis, autoimmune hepatitis and multiple sclerosis. The subject does not have cancer or a predisposition to cancer. The present sequence represents the amino acid sequence of human soluble fibroblast activation protein (FAP) alpha dimer (corresponding to AEB94159 minus N-terminal amino acids 1-26).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. Also included are the following: a composition
                                                                                                                                                                                                                                                                                                                                                                                                                                          Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                responsibility with the second of the second

Jesson MI;

Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response.

Claim 73; SEQ ID NO 4; 177pp; English

The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation protein (FAP) alpha dimer enzyme in a maneunt effective to down-regulate an immune response. Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme comprising an amino acid substitution of A657D; and a composition comprising a FAP alpha dimer enzyme lacking amino acids 269-448 and comprising amino acids 269-448 from mouse FAP.

The second agent is an anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibacterial, antivital, antifungal, anti-infective agent such as antibacterial, antivital, antifungal, anti-infective agent such as antibacterial, antivital, antifungal, anticarsing comparistion and anter enzyme. The FAP alpha dimer enzyme is a truncation mutant. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a heterodimer of a FAP alpha monomer and a DPPIV/CDS monomer. The FAP alpha dimer enzyme comprises an amino acid substitution is present in the beta-propaller domain, the catalytic domain, or an N-linked glycosylation site and alters disulfide bond condition, abnormal immune response selected from inflammation, autodimmune disease, sepsie, graft versus host disease, transplant rejection, toxic shock syndrome, allergy, asthma, atherosclerosis,

(LUDW-) LUDWIG INST CANCER RES

```
ö
osteoarthritis, and Guillain-Barre's syndrome. The abnormal immune response is subsequent to an infection, such as an RSV infection. The autoimmune disease is selected from c, autoimmune thyroiditis, systemic lupus erythematosus (SLE), uveitis, hemolytic anemias, rheumatic fever, crohn's disease, Guillain-Barre's syndrome, psoriasis, Graves' disease, myasthenia gravis, glomerulonephritis, autoimmune hepatitis and multiple colloris. The subject does not have cancer or a predisposition to cancer. The present sequence represents the amino acid sequence of human soluble fibroblast activation protein (FAP) alpha dimer. Note: SEQ ID No:3 AEB94160 only encodes amino acids 84 to 750 the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "Putative functional element; not defined further

This sequence represents a dimeric fibroblast activation protein alpha rhe Pap-alpha) which is capable of degrading extracellular matrix proteins. The Fap-alpha molecule exhibits structural features typical of type II integral membrane proteins, including a large COOH-terminal extracellular domain, a hydrophobic transmembrane segment and a short cytoplasmic tail. Most common types of epithelial cancers including breast, lung, skin, pancreas and colorectal carcinomas contain abundant FaP-alpha reactive stronal fibroblasts which accompany tumour blood vessels. The induction of FAP-alpha fibroblasts at times and sites of tissue remodelling during fetal development, tissue repair and carcinogenesis is consistent with its putative role in normal fibroblast physiology. FAP alpha inhibitors, particularly a collagen derivative or (S)-valy1-pyrrolidine-2(R)-boronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acid, may be used to treat various epithelial cancers, e.g. breast, lung, skin, pancreas or colon cancer. Note: This sequence differs from the amino acid sequence of FAP-alpha found in AAW31963 between residues 625
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lillie J, Gannavarapu M, Glatt K, Hoersh S, Kamatkar S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the dimeric fibroblast activation protein alpha (FAP-alpha). The FAP-alpha molecule is capable of degrading extracellular matrix proteins and exhibits extructural features typical of type II integral membrane proteins, including a large COM+terminal extracellular domain, a hydrophobic transmembrane segment and a short cytoplasmic tail. The putative extracellular domain is described as containing five contential N-glycosylation sites, eleven conserved cysteine residues and three segments corresponding to highly conserved cysteine residues and three segments corresponding to highly conserved catalytic domains characteristic of serine proteases. Most common types of epithelial cancers including breast, lung, skin, pancreas and colorectal carcinomas contain abundant FAP-alpha reactive stromal fibroblasts which accompany tumour blood vessels. The induction of FAP-alpha fibroblasts at times and sites of tissue remodelling during foetal development, tissue repair and carcinogenesis is consistent with its putative role in normal fibroblast physiology FAP alpha inhibitors, particularly a collagen derivative or (S) vally pyrrolidine-2(R) boronic acid, may be used to treat various cepthelial cancers, e.g. breast, lung, skin, pancreas or colon cancer. Note: This sequence differs from the amino acid sequence of FAP-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                   Dimeric fibroblast activation protein alpha - capable of degrading extracellular matrix protein, useful to treat epithelial cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        625. .670

The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACCS0076 to ACCS0334 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a patient sample and the normal level of patient sample and the normal level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) or lymphatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              growth; differentiation; blood endothelial cell; BEC; lymphatic endothelial cell; LEC; hereditary lymphoedema; VEGFR-1; lymphatic growth agent; VEGF-C; VEGF-D; antianglogenic; cytostatic; vasotratic; antiinflammatory; gene therapy; endothelial cell disorder; inflammatory disease; cancer metastasis; lymphatic system; human.
                                                       Breast cancer diagnosis or treatment by comparing the level of expriof a marker in a patient sample with that in the control non-breast cancer sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Saharinen P, Saharinen J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 65; DB 6; Length 760; 100.0%; Pred. composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises identifying a human subject with lymphoedema and with a mutation in at least one allele of a gene encoding a LEC protein, where the mutation correlates with lymphoedema in human subjects, and with the proviso that composition comprising a lymphatic growth agent selected from VEGF-C or VEGF-D polypeptides and polymuclecides. The invention may be useful for the development of compounds with an antianglogenic, cytostatic, the development of compounds with an antianglogenic, cytostatic, wasotropic or antiinflammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphatic endothelial cells, in treating hereditary predisposition to the disporder or in monitoring the efficacy or toxicity of a drug on endothelial cells. The agent is useful in manufacturing a medicament for the differential modulation of blood vessel endothelial cell or lymphatic growth agent may also be used in manufacturing a medicament for the treatment of hereditary lymphoedema resulting from a mutation. The cllor of other diseases involving the lymphatic vessels, such as LEC gene or of other diseases involving the lymphatic vessels, such as LEC gene or of other diseases and cancer metastesis via the lymphatic synemial production which is related to the method of the invention. Our expressed protein which is related to the method of the invention. Our was expressed protein which is related to the method of the invention of a human LEC/BEC differentially which appears in the present sequence is that of a human LEC/BEC differentially and a present appear in the present and the process on the method of the invention. This sequence does not appear in the specification but was obtained by the indexer using the source data given in table 14 of the specification.

Barly detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

Example 2; SEQ ID NO 4171; 210pp; English

```
ö
The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual data and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples and comparing the expression in the first soft tissue sample indicates the presence of soft tissue sarcome amples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "Cytochrome c family heme-binding site signature"

The present sequence is that of novel tumor-associated antigenic target polypeptide TAT430. TAT polypeptides have been identified ADM44770. ADM14776 whose expression is upregulated in particular tumor tissues. Tissue expression profiling using GeneExpress indicated that TAT430 is upregulated in breast, pancreatic, colon, adrenal, bladder, kidney, lymphoid, ovarian, prosters and stomach tumor stroma as compared to the corresponding healthy tissues. Upregulation in ovarian tumor tissue was confirmed by quantitative analysis of TAT mRNA expression, and upregulation in breast, pancreatic, colon, adrenal and bladder tumors was confirmed by gene expression profiling in silico (GEPIS) analysis. The TAT polypeptide may comprise the full-length polypeptide, or may lack the associated signal peptide, or may lack the associated signal peptide, or may be any of these fused to a heterologous polypeptide such as an epitope tag, or the Por region of an immunoglobulin. Tat polypeptide so the

Jesson MI;

Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response.

The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation protein in a place and activation and protein in a manount effective to down-regulate an immune response. Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme ladder absorbed as the most and a composition comprision a FAP alpha dimer enzyme as adjuvant; a manno acide 269-448 and comprises administering to the subject a second agent. The method further comprises administering to the subject as second agent. The faP alpha dimer enzyme is a truncation canti-infective agent such as antibacterial, antiviral, antifungal, anti-infective agent such as antibacterial, and a pharamator or an arti-mycobacterial agent. The FAP alpha dimer enzyme is a truncation and paper alpha dimer enzyme is a truncation and paper appla dimer enzyme is a ferencial agent. The FAP alpha dimer enzyme is a substitution relative to wild type FAP alpha dimer. The amuno acid substitution relative to wild type FAP alpha dimer. The amuno acid substitution, and noting all and an especially an il-infective formation. The immune response is an especially an inflammation, condition, abnormal immune response selected from inflammation,

autoimmune disease, sepsis, graft versus host disease, transplant rejection, toxic shock syndrome, allergy, asthma, atherosclerosis, osteoarthritis, and Guillain-Barre's syndrome. The abnormal immune response is subsequent to an infection, such as an RSV infection. The autoimmune disease is selected from c. autoimmune thyroiditis, systemic lupus exthematosus (SLE), uveitis, hemolytic anemias, rheumatic fever, Crohn's disease, Guillain-Barre's syndrome, psoriasis, Graves' disease, Crohn's disease, autoimmune hepatitis and multiple sclerosis. The subject does not have cancer or a predisposition to cancer. The present sequence represents the amino acid sequence of human wild type fibroblast activation protein (FAP) alpha dimer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Down-regulating an immune response comprises administering to a subject
in need a fibroblast activation protein (FAP) alpha dimer enzyme in an
amount effective to down-regulate an immune response.

The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation of protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme is a composition of A657D; and a composition comprising an unino acide 269-448 and comprising an inno acide 269-448 and comprising and no cide 269-448 from mouse FAP.

CC fromethod further comprises administering to the subject a second agent.

CC anti-infective agent is an anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibacterial, antiviral, antifungal, or anti-infective argume. The FAP alpha dimer enzyme is a truncation mutant. The FAP alpha dimer enzyme is a truncation causation or anni-infection or paragine or alpha dimer enzyme is a far an anti-infection, and an anti-infection and engaged and an especially an IL-I mediated condition, abnormal immune response is an especially an IL-I mediated condition, abnormal immune response is elected from inflammation, crant condition, abnormal immune response is an especially an IL-I mediated condition, abnormal immune response is an especially an IL-I mediated condition, abnormal immune response is subdiscer in the beta-propaler disease, transplant crejotion, costeoarthritis, and cuillain-Barre's syndrome. The abnormal immune disease, as an RSV streetion. The archimume disease, as all an anti

or physiological responses in a cell, tissue, organ or organism.

Specifically, it refers to the use of biologically active fragments for diagnostic assays and furthernore in the treatment of diverse pathological conditions. The present invention describes novel human and murine NOVX proteins, as well as methods to modulate their expression using antisense oligos, ribozymes and peptide nucleic acids.

The NOVX polypeptides, polymucleotides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, creating or preventing diseases such as inflammation, autoimmune treating or preventing diseases such as inflammation, autoimmune disorders, allergies, blood disorders, acquired immunodeficiency syndrome treating or preventing diseases such as inflammation, autoimmune comparative, allergies, blood disorders, acquired immunodeficiency syndrome disorders, allergies, blood disorders, acquired immunodeficiency syndrome comparative, allergies, infections, stroke, muscular dystrophy and epilepsy. Accordingly, these molecules have many activities including cyclostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, antisathmatic, nephrotropic, antiarteriosclerotic, anorectic, antisathmatic, nephrotropic, antibacterial, virucide, antiparasitic, crelaxant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, cused as in chromosome mapping, tissue typing, preventive medicine and pharmacogenesis, wound healing and anglogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and pharmacogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid sequence comprising DPP10 mRNA, useful for the manufacture of a medicament for regulating DPP10 protein expression or

The present invention describes a new isolated nucleic acid sequence (1) comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also known as prolyloligopeptidase). (1) has antinifammatory, antiasthmatic, antiasthmatic, antiasthmatic, antiathmatic and antirheumatic activities, and can be used in vaccines and gene therapy. A composition comprising (1) can be used for the manufacture of a medicament for regulating DPP10 expression or for preventing or treating inflammatory disease e.g., inflammatory bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (1) can also be used in an assay for detecting or measuring DPP10 in a sample. A host cell comprising (1) can be used for producing recombinant DPP10 gene products, or in drug screening systems to identify agents for disgnosis or treatment of individuals having or susceptible to inflammatory disease. Human DPP10 is located on chromosome 2; more specifically chromosome 2414. Ag084254 to AB084612 and ABPS5559 to ABPS5629 represent chromosome and in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  c26 is a human T cell antivation antigen originally identified by its reactivity with the MAD Tal. C26 cDNA library was constructed from human PhA-activated T cells using the CDM7 vector. Fragments of CD26 can be prepd in the following manner. CD26 Xbal-SphI cDNA fragment is ligated to the vector RcSR-alpha-26 Xbal-HindIII DNA fragment and the linker AAQ46092. The linker introduces an in-frame stop codon that results in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polypeptide fragments of CD26 - are capable of disrupting binding of CD45 and CD26 and thus interfering with T-cell activation.
for preventing or treating inflammatory disease e.g., inflammatory bowel
disease.

The analogues pref. lack residues 3-9 or 24-34. These analogues are soluble under physiological conditions and lack enough amino acid residues to render them susceptible to cleavage by signal peptidase. The peptide fragments and analogues are useful as immune or response- stimulating therapeutics, eg. they may be used for treatment of disease conditions characterised by immunosuppression, eg. AIDS or AIDS-related complex, other virally or environmentally-induced conditions, and certain congenital immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               deficiencies. The peptides can be employed to increase immune function which has been impaired by use of immunosupressive drugs, such as certain chemotherapeutic drugs. (Updated on 25-MAR-2003 to correct PN field.)
the deletion of the segment of CD26 from AA 594 to the carboxy terminus of the wild-type protein. This deletion mutant, shown in AAR40916, lacks the putative catalytic site of CD26 and has a new carboxy terminus given in AAR40917. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptide fragments and analogues of CD26 and encoding nucleic acid useful for stimulating immune response, e.g. for treatment of AIDS to counteract immunosuppressive drug, and as vaccine adjuvant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; T cell activation antigen; CD26; analogues; deletion; soluble; signal peptidase; immune-stimulating; response-stimulating; AIDS; immunosuppression; AIDS-related complex.

Expression of CD26 enhances the sensitivity of the cancer cell to the chemotherapeutic or radiotherapeutic agent. CD26 is a dipeptidyl peptidase IV (DPPIV). The chemotherapeutic agent is a useful for inhibitor. The CD26 composition of the invention is useful for inhibiting the growth of a cell, inducing cell cycle arrest in a cell, killing a cancer cell, potentiating the effect of a chemotherapeutic agent and/or a radiotherapeutic agent on a tumour cell, inducing or enhancing apoptosis of a cancer cell, treating cancer, or inducing tumour regression or tumour necrosis. The CD26 composition is further useful for increasing topolsomerase II expression in a cell, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of a CD26 composition, and a chemotherapeutic and/or a radiotherapeutic agent for e.g. inhibiting the cell growth, inducing cell cycle arrest, killing a cancer cell, treating cancer, or inducing tumor regression or tumor necrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activating an antigen-presenting call, or for potentiating immune responses of an animal. The present sequence represents a CD26 protein, and is encoded by vectors which are used to produce compositions of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The sequences given in AAR54612-14 represents analogues of the human T cell activation antigen CD26 which have internal deletions. The analogues pref. lack residues 3-9 or 24-34. These analogues are soluble under physiological conditions and lack enough amino acid residues to render them susceptible to cleavage by signal peptidase. The peptide fragments and analogues are useful as immune or response- stimulating therapeutics, eg. they may be used for treatment of disease conditions characterised by immunosuppression, eg. AIDS or AIDS-related complex, other virally or environmentally induced conditions, and certain congenital immune deficiencies. The peptides can be employed to increase immune function which has been impaired by use of immunosupressive drugs, such as certain chemotherapeutic drugs. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
with an allosteric binding site of DPP-IV. The compound is an inhibitor of DPP-IV activity. (I) is useful for the identification and/or design of inhibitors of DPP-IV activity. (II) is useful as a therapeutic active substance, in particular for the treatment of diabetes type I, diabetes type II, iGT, obesity and cancer. (II) is useful for the manufacture of medicament for the treatment of above mentioned disease. The present sequence represents the extracellular domain of human DPP-IV, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polypeptide fragments and analogues of CD26 and encoding nucleic acid useful for stimulating immune response, e.g. for treatment of AIDS to counteract immunosuppressive drug, and as vaccine adjuvant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AARS4612-14 represents analogues of the human T cell activation antigen CD26 which have internal deletions. The analogues pref. lack residues 3-9 or 24-34. These analogues are soluble under physiological conditions and lack enough amino acid residues to render them susceptible to cleavage by signal peptidase. The peptide fragments and analogues are useful as immune or response- stimulating therapeutics, eg. they may be used for treatment of disease conditions characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunosuppression, eg. AIDS or AIDS-related complex, other virally or environmentally-induced conditions, and certain congenital immune environmentally-induced conditions, and certain congenital immune which has been impaired by use of immunosupressive drugs, such as certain chemotherapeutic drugs. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reactivity with the Mab Tal. C26 cDNA library was constructed from human PhA-activated Teals using the CDNA library was constructed from human the predicted CD26 polypeptide has the characteristics of a signal sequence of the type II membrane protein, which is reinforced by the observation that potential N-glycosylation sites are located in the carboxy side of the hydrophobic core. Therefore the N-terminal 6 AAs are predicted to be cytoplasmic, the next 22 AAs are predicted to transverse the cytoplasmic, the next 22 AAs are predicted to transverse the cytoplasmic membrane, and the 738 C-terminal AAs constitute the constitute the

```
Treating a patient for mucosal inflammation associated with rhinitis, sinusitis or both, by intranasally administering a peptidase that cleaves at Xaa-Pro sequences, to the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Thus invention relates to the treating of a patient for mucosal inflammation associated with rhinitis or sinualtis, comprising intransally administering a peptidase. The peptidase is considered antiasthmatic, antiallergic and antiinflammatory in its action. The peptidase cleaves at Xaa-Pro sequences and is useful for treating a patient for mucosal inflammation associated with rhinitis or sinusitis, which is the result of allergies or asthma. This sequence represents human dipeptidyl peptidase IV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Prostate cancer; prostate tumour tissue; human; mammal; cytostatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents the human T cell activation antigen CD26. The invention is concerned with polypeptide fragments and analogues of CD26 which have internal deletions (see also AAR54612-14). The analogues preflack residues 3-9 or 24-34. These analogues are soluble under physiological conditions and lack enough amino acid residues to render them susceptible to cleavage by signal peptidase. The peptide fragments and analogues are useful a immune or response- stimulating therapeutics, eg. they may be used for treatment of disease conditions characterised by immunosuppression, eg. AIDS or AIDS-related complex, other virally or environmentally-induced conditions, and certain congenital immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          deficiencies. The peptides can be employed to increase immune function which has been impaired by use of immunosupressive drugs, such as certain chemotherapeutic drugs. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptide fragments and analogues of CD26 and encoding nucleic acid useful for stimulating immune response, e.g. for treatment of AIDS to counteract immunosuppressive drug, and as vaccine adjuvant.
                                                                                                                                                                                                                                                                                                               Human; T cell activation antigen; CD26; analogues; deletion; soluble; signal peptidase; immune-stimulating; response-stimulating; AIDS; immunosuppression; AIDS-related complex.

The present invention relates to methods of detecting a prostate cancerassociated transcript in a cell from a patient. The method comprises contearing a blological sample from the patient with prostate cancerassociated polynuclectides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancerassociated polynuclectide sequences are differentially propersed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancerase associated genes are useful for diagnosing or treating prostate cancer in associated genes are useful for diagnosing or treating prostate cancer.

The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.

ABG61800-ABG61944 represent prostate cancer-associated proteins
                                                                                                                                                                                                                                                                                                                                       Detecting a prostate cancer-associated transcript in a cell in a patient, useful for diagnosing prostate cancer (PC) or screening modulators of PC, by determining if prostate cancer-associated genes are expressed in a

                                                                                                                                                                                                                                                                                                                                                                                                               prostate tissue.
```

This invention islance countries antiatehritic, neuroprotective, antithyroid, dermatological, antiatehritic, antiasthmatic, antiasthmatic, antiphyroid, dermatological, antiphyroid, antiasthmatic, antiasthmatic, antianthroid, cophthalmological, antiphyroid, antiandian, antianthroid, cardiant, antianthrosolerotic, anorectic and metabolic in its action. Uses include antiatherosolerotic, anorectic and metabolic in its action. Uses include therapy, expression or activity of 21953 protein modulator, it is gene therapy, expression or activity of 21953 protein modulator, it is preventing, treating or detecting a cellular proliferative or differentiative disorder. The 21953 molecules can act as novel diagnostic targets and therapeutic agents for controlling disorders associated with the cell differentiation and proliferation such as cancer, immune function, reproductive, neurological and cardiovascular function. The 21953 molecules are thus useful for treating and preventing cellular proliferative and differentiative disorders, haematopoietic neoplastic disorders, arthritis, multiple selezosis, asthma, grave's disease, mellitus, arthritis, multiple selezosis, asthma, grave's disease,

mellitus, arthritis, multiple sclerosis, asthma, Grave's disease, neuronal disorders, demyelinating diseases, vascular disorders and metabolism or pain disorders. This sequence represents the amino acid sequence of human dipeptidyl peptidase IV

Sequence 766 AA;

This invention relates to an isolated 21953 human prolyl oligopeptidase.

Disclosure; Fig 3; 121pp; English

New polypeptides 21953, member of human prolyl oligopeptidase family, useful as diagnostic targets and therapeutic agents for controlling cancer, lymphoma and leukemia.

                                                                                                                                                                                                                                                                  The invention comprises a method of identifying a subject that is susceptible to developing angiodemic conditions during a course of treatment. The method of the invention involves administering an angiotensin converting enzyme (ACE) inhibitor or a vasopetidase inhibitor and determining dipeptidial peptidase IV (DPP IV) enzyme activity or aminopeptidase P (APP) enzyme activity. The method of the invention is useful for identifying/diagnosing susceptibility to developing angiodemic conditions during a course of treatment involving the administration of an ACE inhibitor or a vasopeptidase inhibitor. The method is particularly useful during the treatment of a subject that is in med of or taking an ACE inhibitor and/or a vasopeptidase inhibitor, which are commonly used in the treatment of hypertension, diabetes, cardiac disease and renal diseases. The present amino acid sequence corresponds the human dipeptidyl peptidase IV (DPP IV)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention describes a new isolated nucleic acid sequence (I) comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also known as prolylolidyopeptidase). (I) has antiinflammacory, antiaethmatic, antiaethmatic, antiaethmatic, antiaethmatic, antiaethmatic, antiaethmatic, antiaethmatic, antipeoriatic, and artirheumatic activities, and can be used in vaccines and gene therapy. A composition comprising (I) can be used in vaccines and gene therapy. A composition comprising (I) can be used disease, asthma, atopy, rheumatory disease e.g., inflammatory cor for preventing or treating inflammatory disease e.g., inflammatory cor for pused in an assay for detecting or measuring DPP10 expression cor products, or in drug screening systems to identify agents for diagnosis or treatment of individuals having or susceptible to inflammatory disease. Human DPP10 is located on chromosome 2, more specifically chromosome 2414. ABQ84254 to ABQ84612 and ABP55569 to ABP55629 represent correction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tissue-specific endothelial membrane protein; antibacterial; virucide; fungicide; antiparasitic; anticonvulsant; neuroleptic; cytostatic; antiparkinsonian; nootropic; neuroprotective; antiathmatic; infection; antidiabetic; hypotensive; nephrotropic; antiarthritic; antinflammatory; gene therapy; epilepsy; schizophrenia; cancer; Parkinson's disease; Alzheimer's disease; asthma; diabetes; hypertension; arthritis; polycystic kidney disease; tissue-specific luminally expressed protein;
                                                                         New nucleic acid sequence comprising DPP10 mRNA, useful for the manufacture of a medicament for regulating DPP10 protein expression or for preventing or treating inflammatory disease e.g., inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human liver dipeptidyl peptidase IV (DPP4) protein SEQ ID NO:7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The present invention describes a method (M1) for delivering an therapeutic agent to a specific tissue, comprising administering an encount of a therapeutic complex comprising a ligand which binds to a mount of a therapeutic complex comprising a ligand which binds to a c tissue-specific luminally expressed protein, a therapeutic group, and a complex membrane proteins from the present invention can have antibacterial, or virucide, fungicide, antiparasitic, anticonvulsant, neuroleptic, cycostatic, antiparkinsonian, noctropic, neuroprotective, antisathmatic, antidiabetic, hypotensive, nephrotropic, antiarthritic and antidiamatory activities, and can be used in gene therapy. (M1) is cuseful in targeting pharmaceuticals or other therapeutics to specific tissues using tissue-specific endothelial membrane proteins. A therapeutic complex may be used to treatment would be efficacious, such at in cases of infections (e.g. bacterial, viral, fungal and parasitic), chicases, asthma, diabetes hypertension, polycystic kidney disease, arthritis, and inflammatory bowel disease. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                       Delivering a therapeutic agent (e.g. immunosuppressant) to a specific tissue, comprises administering an amount of a therapeutic complex comprising a therapeutic group, a ligand that binds to a tissue-specific protein, and a linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotides and polypeptides for predicting the activity of

```
The present invention describes a predictor set comprising a plurality of polymucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity of cells, comprising obtaining a sample of cells, pathway. Also described: (1) predicting whether a compound is capable of modulating the activity of cells, comprising obtaining a sample of cells, cerelating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of markers, and correlating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of cell lines for correlate with compound sensitivity or resistance of cells associated with a disease state, and (3) identifying polymucleotides and colypeptides that predict compounds, analysing the expression pattern of a microarray of polymucleotides tate, comprising subjecting the plurality of cell lines to one or more compounds, analysing the expression pattern of a microarray of polymucleotides or polypeptides that predict the sensitivity or censistance of cells associated with a disease state by using the expression pattern of the microarray. The polymucleotides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinase pathways. These may be used in determining drug cancer) based on patient response at a molecular level. The present concern based on patient response at a molecular level. The present concerns and in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mucosal inflammation; rhinitis; sinusitis; exopeptidase; substance P; SP; neurokinin 1 receptor; NK1 receptor; allergy; asthma; antiallergic; antinflammatory; antiasthmatic; human; dipeptidyl peptidase IV; DPPIV;

                                                                                                                                                                                                                                                                             ö
                                                                                                            method comprises intranasally administering to the patient a peptidase that cleaves at Xaa-Pro sequences or an agent that inhibits the binding of substance P (SP) to the neurokinin 1 (NK1) receptor. The peptidase is an exopeptidase, preferably selected from human dipeptidyl peptidase is peptidase 9, or human attractin. The method is useful for treating a patient for mucosal inflammation associated with rhintis and/or pinusitis which are the result of allergies or asthma. The invention provides an effective treatment of the inflammation associated with both rhintis and sinusitis. The present sequence represents human DPPIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

the invention interiors a compression of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the nucleic acid sequence. Also comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of a first animal of subjected to pain, a method for identifying an agent compound that regulates the activity of one or more of the expression an animal subjected to pain, a method for identifying a compound which regulates the activity of one or more of the compound that regulates the activity of one or more of the polypeptides or method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polypeptides or their antibodies. The polynucleotide or the compound that to reading the activity is useful for preparing a medicament for treating can animal segmental nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human procein (described in Table 3 therapy). The sequence data for this parent did not form part of the printed or specification) which is differentially expressed during pain.

Note: The sequence data for this parent did not form part of the printed specification) which is differentially expressed during pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
The invention discloses a composition comprising two or more isolated rat

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                          The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

whose expression is upregulated or downregulated in specific cancers or
cher diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
c patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
conclination also relates to expression vectors and host cells comprising a
c nucleic acid of the invention; antibodies which specifically bind a
c polypeptide of the invention; use of such antibodies for drug targeting;
conclination of screening for modulators of activity or expression of the
polypeptides and nucleic acids. The nucleic acids, polypeptides,
c antibodies and methods are useful for diagnosing, prognosing and treating
cancer and other conditions such as psoriasis, ischaemia, heart disease,
atherosaclerosis, infilammatory diseases, autonimune diseases, retinal
c neovascularistation syndromes, scarring and uterine fibroids. They may
also be useful in wound healing and in contraception. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                              Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  fibrotic disorder; psoriasis; ischaemia; heart disease; atherosclerosis; inflammatory disease; autoimmune disease; retinal neovascularistation syndrome; scarring; uterine fibroid; detection; diagnosis; prognosis; drug screening; drug targeting; wound healing; contraception; cytostatic; cardiant; immunomodulatory; vulnerary; gene therapy; vaccine.

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

whose expression is upregulated or downregulated in specific cancers or
other diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising
nucleic acid of the invention; use of such antibodies for drug targeting;
polypeptide of the invention; use of such antibodies for drug targeting;
onlypeptides and nucleic acids. The nucleic acids, polypeptides,
antibodies and methods are useful for diagnosing, prognosing and treating
antibodies and methods are useful for diagnosing, isonosing and treating
antibodies and methods are useful for diagnosing, isonosing and treating
antibodies accountions such as posiasis, ischaemia, heart disease,
atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
antibodies and methods are useful for diagnosing, isonosing and part disease,
anterosclerosis, inflammatory diseases, autoimmune diseases, retinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel crystal of a dipeptidyl peptidase IV (DPPIV) which is sufficient to ensure a resolution capable of analysing its three-dimensional structure up to the side chain level by X-ray crystallographic structural unalysis. The crystal of the invention demonstrates immunomodulatory, antidiabetic, antinflammatory, antidiabetic, antinflammatory, antidiabetic, antinflammatory, structural cordinates and may be useful for providing a three-dimensional structural coordinate as the information for designing, identifying, structural coordinate as the information for designing, identifying, the effector may be useful as a modulatory agent of immune response and as a therapeutic or prophylactic agent for diabetes, inflammation, multiple sclerosis, grave's disease, chronic rheumatoid arthritis, AIDS or cancer. The current sequence is that of the human full-length colon dipeptidyl peptidase IV (DPPIV) protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           dimensional structure, useful for designing, identifying, evaluating or searching an effector of the dipeptidyl peptidase IV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New crystal of dipeptidyl peptidase IV capable of analyzing its three-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Marker gene related amino acid sequence SEQ ID NO:565.

셤 ò

```
The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy campact, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial colls are calls are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels action of obstructive pulmonary disease; (c) a kit for screening for a chronic obstructive pulmonary disease; (d) an inducer that induces bronchial asthma or chronic obstructive pulmonary disease; (d) an inducer that induces bronchial asthma or chronic obstructive pulmonary disease; (e) a marker gene or an antisense mucleic acid corresponding to a portion of the marker gene, a riboxyme, a polymucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising to a protein encoded by a marker gene; and (7) a DNA chip for testing for bronchial asthma or a chronic obstructive pulmonary disease, on which a group contial antibod is an ensemble of the gene through an RNAi effect or an antibody and antiasthmatic activities, and can be used in gene therapy. The method can be used in gene therapy. The method can be used in gene therapy and particity and antiasthmatic activities, and can be used in gene therapy. The respection of the gene through and the particity and antiasthmatic activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Resting for bronchial asthma or chronic obstructive pulmonary disease by
epithelial cell; interleukin-13; respiratory; antiasthmatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 aring the expression level of a marker gene in a biological sample a subject with the expression level of the gene in a sample from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        bronchial asthma or chronic obstructive pulmonary disease. The present sequence is used in the exemplification of the present invention.

Novel PRO polypeptide e.g., PRO69614, PRO71106, or PRO86388 useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             rheumatoid arthritis; ostecarthritis; juvenile chronic arthritis; systemic sclerosis; Sjogren's syndrome; vasculitis; sarcoidosis; autoimmune thrombocytopenia; thyroiditis;
                                                                              autoimmune haemolytic anaemia; autoimmune thrombocytopenia; thyroiditis; diabetes mellitus; renal disease; demyelinating disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic arthritis, solutions, and arthritis, autoimmune haemolytic and arthritis, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            central or peripheral nervous system, demyelinating polyneuropathy, Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy. This sequence represents a human PRO polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Schoenfeld J, Williams PM;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; PRO; immune related disorder; systemic lupus erythematosus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic arthritis, systemic haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating diseases of the Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy, polyneuropathy. This sequence represents a human PRO polypeptide of the

The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic arthritis, syndrome, vasculitis, sarcoidosis, autoimmune haemolykic ansemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating diseases of the Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy, polyneuropathy. This sequence represents a human PRO polypeptide of the

The specification describes a CD26 composition which, in conjunction with chemotherapeutic or radiotherapeutic agents, is used for the treatment and prevention of cancers. Expression of CD26 enhances the sensitivity of the cancer cell to the chemotherapeutic or radiotherapeutic agent. CD26 is a dipeptidyl peptidase IV (DPPIV). The chemotherapeutic agent is a copoisomerase II inhibitor. The CD26 composition of the invention is useful for inhibiting the growth of a cell, inducing cell cycle arrest in a cell, killing a cancer cell, potentiating the effect of a cell, chemotherapeutic agent and/or a radiotherapeutic agent on a tumour cell, inducing or enhancing apoptosis of a cancer cell, treating cancer, or inducing tumour regression or tumour necrosis. The CD26 composition is curther useful for increasing topoisomerase II expression in a cell, for activating an antigen-presenting cell, or for potentiating immune responses of an antigen-presenting cell, or for potentiating immune responses of an antimal. The present sequence represents a CD26 protein, and is encoded by vectors which are used to produce compositions of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of a CD26 composition, and a chemotherapeutic and/or a radiotherapeutic agent for e.g. inhibiting the cell growth, inducing cell cycle arrest, killing a cancer cell, treating cancer, or inducing tumor regression or tumor necrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                   The specification describes a CD26 composition which, in conjunction with chemotherapeutic or radiotherapeutic agents, is used for the treatment that prevention of cancers. Expression of CD26 enhances the sensitivity of the cancer cell to the chemotherapeutic or radiotherapeutic agent. CD26 is a dipeptidyl peptidase IV (DPPIV). The chemotherapeutic agent is a useful for inhibiting the GD26 composition of the invention is a cell, killing a cancer cell, potentiating the effect of a chemotherapeutic agent and/or a radiotherapeutic agent on a tumour cell, inducing or enhancing apoptosis of a cancer cell, treating cancer, or inducing or enhancing apoptosis of a cancer cell, treating cancer, or inducing tumour regression or tumour necrosis. The CD26 composition is further useful for increasing topologemerase II expression in a cell, for
                                                                                                          Use of a CD26 composition, and a chemotherapeutic and/or a radiotherapeutic agent for e.g. inhibiting the cell growth, inducing cell cycle arrest, killing a cancer cell, treating cancer, or inducing tumor regression or tumor necrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying a mammal that will respond therapeutically to a method of treating cancer comprises comparing the level of a biomarker in a mammal before and after exposure to an epidermal growth factor receptor (EFGR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    activating an antigen-presenting cell, or for potentiating immune responses of an animal. The present sequence represents a CD26 protein, and is encoded by vectors which are used to produce compositions of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    growth factor receptor modulator; identification; cancer; EGFR; biomarker.

The invention relates to a method of identifying a mammal that will respond therapeutically to a method of treating cancer by administering an epidermal growth factor receptor (EGFR) modulator by comparing the cancer by comparing the level of a biomarker in a mammal before and after exposure to an EGFR modulator. The method comprises: (a) measuring, in the mammal, the level of at least one biomarker identified in the specification; (b) exposing the mammal to the EGFR modulator; and (c) measuring in the mammal the level of the biomarker, where a difference in the level in step (c) therapeutically to the method of treating cancer. The method and compared to step (a) indicates that the mammal will respond therapeutically to a method of treating cancer. The method and therapeutically to a method of treating cancer by administering an epidermal growth factor receptor (EGFR) modulator. This sequence corresponds to one of the biomarkers whose levels of expression is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide perves as least 80% identical to the TAT nucleic acids and polypeptide polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or atibodies, antagonists, binding molecules and compositions are useful for diagnosin or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, cervical cancer, liver cancer, bacterial cancer, cervical cancer, cancers of the central cancer, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT polypeptide.

bronchial cancer comprising 489 defined sequences given in the bronchial cancer comprising 489 defined sequences given in the bronchial cancer comprising 489 defined sequences given in the compounds with a cytostatic activity through the inhibition of expression or activity of tumour-associated proteins. The novel DNA sequences and cor activity of tumour-associated by them are used for detecting bronchial cancer or determining the risk of developing it and to screen for specific binding partners of the DNA or protein sequences, where the binding partners are potentially useful as agents for treating or diagnosing bronchial cancer. The DNA or protein sequences can also be used for prognosis, detection of metastases and for secondary treatment of tumours that have been stabilised or are no longer detectable). Detecting abnormal expression of the DNA sequences provides early diagnosis of bronchial cancers. The present sequence is that of a protein encoded by a novel bronchial cancer-associated human gene sequence of the
New nucleic acid, and derived proteins, useful for diagnosis of bronchial cancer and in screening for therapeutic and diagnostic agents.

The present sequence is the protein sequence of human dipeptidylpeptidse IV (DPP4). The invention relates to novel disease associations of DPP4 polypeptides and polymucleotides and to novel methods of screening for therapeutic agents for the treatment of cardiovascular disorders, cancer, hematological disorders and metabolic diseases. Pharmaceutical compositions are provided for treatment of these diseases and disorders and comprise a DPP4 polypeptide, an DPP4 polymucleotide, or regulators of DPP4 or modulators of DPP4 molecule, an antibody or a riboxyme. The invention also provides methods of disagnosing diseases and disorders associated with DPP4 by amount of a DPP4 polymucleotide in a sample amount of a DPP4 polymucleotide in a sample amount in a sample from a healthy and/or diseased mammal. The diseases and disorders include Parkinson's disease, and disorders include Parkinson's disease, and disorders include Parkinson's disease, and an antibody or a riboxyme of disease, and disorders include Parkinson's disease, and disorders include Parkinson's disease, and disorders include Parkinson's disease, and an antibody or a riboxyme or a parkinson's disease, and disorders include Parkinson's disease, and disorders include Parkinson's disease, and disorders and disease. ö myocardial infarction, arrhythmias, atherosclerosis, anemia, eosinophilic disorders, leukemia, panoreatitis, Crohn's disease, inflammatory bowel disease, diabetes, Cushing's syndrome, systemic lupus erythematosus, myaerhenia gravis, rheumatoid arthritis, psoriasis, scleroderma, or e.g. cardiovascular, metabolic, inflammatory, or Gaps ö Length .766; 0; Indels Score 53; DB 8; Pred.                                The present invention relates to a method for diagnosing of pre-diabetes, diabetes or susceptibility to diabetes. The method involves obtaining a biological sample and detecting or measuring the level of a polypeptide marker, such as vascular endothelial growth factor B or apolipoprotein of the invention is useful for treating diabetes and pre-diabetes. The present sequence is the human diapetidyl apptidates IV (DPDIV, DPP4) protein. Diapetidyl peptidates IV is also known as CD26, ADCP2, TP103, ADABP: adenosine deaminase complexing protein 2 and Tcell activation
                                                                                                                                                                                                                                                                                                                      Gaрв

The method involves determining the level of an infectious agent, toxic chemical, or dietary protein derived antigen, or their antibodies in samples of patient, and comparing antigens/antibodies levels with normal levels of antigens/antibodies from control subjects. The method of the invention is useful for determining the etiology of an autistic spectrum disorder, such as autism, pervasive development disorder and Asperger's syndrome. The present amino acid sequence represents a human dispetidyl peptidase IV enzyme that was used
                                                                                                                                                                                                                                                                                                                                                       Determining etiology of autistic spectrum disorder in patient, by determining level of infectious agent/toxic chemical/dietary protein derived antigen in samples of patient, comparing it with normal level of antigens of control subjects.

The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate protein (FAP) alpha dimer enzyme in an amount effective to down-regulate carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a RAP alpha dimer enzyme lacking amino acids 269-448 and comprising a RAP alpha dimer enzyme lacking amino acids 269-448 and comprising a mino acids 269-448 from mouse FAP.

The second agent is an anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibacterial, antiviral, antifungal, anti-infective agent such as antibacterial agent. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a heterodimer of a FAP alpha monomer and a ppriv, CD26 monomer. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a heterodimer of a FAP alpha monomer and a ppriv, CD26 monomer. The FAP alpha dimer enzyme is a heterodimer of a FAP alpha dimer enzyme is comprised an amino acid substitution is present in the beta-propeller (formit on an N-linked glycosylation site and alters disulfide bond formation, abnormal immune response selected from inflammation, controlled acceptable, graft versus host disease, transplant response is subsequent to an infection, such amenatic fever; catchimume disease, sepsie, graft versus host disease, rheumatic graves, disease, continumne disease is selected from c, autoimmune disease is selected from c, autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Crohn's disease, Guillain-Barrer's syndrome, psoriasis, Graves' disease, myasthenia gravis, glomerulonephritis, autoimmune hepatitis and multiple sclerosis. The subject does not have cancer or a predisposition to cancer. The present sequence represents the amino acid sequence of human CD26/dipeptidyl peptidase IV (DPPIV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response.
respiratory syncytial virus infection; respiratory-gen.; virucide; CD26 dipeptidyl peptidase IV; DPPIV.
                                                                                                                                                                                                                                                                                                                                                                          Jesson MI;

                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents rat dipeptidyl peptidase IV (DPPIV). The invention relates to the murine monoclonal antibody F-16 (FERMP-17016), which suppresses complement-mediated cell damage by specifically binding too DPPIV, thereby inhibiting complement activation. The invention also relates to the F-16 hybridoma which secrets the monoclonal antibody and and DPPIV. The F-16 hybridoma was produced by fusion of a mouse myeloma cell and a splenocyte obtained from a mouse incculated with rat glomerulus protein extract. The F-16 antibody was subsequently found to bind to DPPIV. The F-16 antibody is useful for treating diseases caused by complement—ediated cytocoxicity, such as myocardial infarction,
                                                                                                                                                                                                                                                                                                                                                        Monoclonal antibody specific for dipeptidyl peptidase, useful for prevention and treatment of nephritis, arthritis, neuropathy and myocardial infarction resulting from complement-dependent cell damage.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Delivering a therapeutic agent (e.g. immunosuppressant) to a specific tissue, comprises administering an amount of a therapeutic complex comprising a therapeutic group, a ligand that binds to a tissue-specific protein, and a linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method (M1) for delivering a therapeutic agent to a specific tissue, comprising administering an amount of a therapeutic complex comprising a ligand which binds to a tissue-specific luminally expressed protein, a therapeutic group, and a linker which links the group to the ligand. Tissue-specific endothelial membrane proteins from the present invention can have antibacterial, virucide, fungicide, antiparsitic, anticonvulsant, neuroleptic, cytostatic, antiparkinsonian, nootropic, neuroprotective, antiasthmatic, antidiabetic, hypotenaive, nephrotropic, antiarthritic and antiinflammatory activities, and can be used in gene therapeutice to specific tissues using tissue-specific endothelial membrane proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ü
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  therapeutic complex may be used to treat or diagnose any disease for which a tissue or organ-specific treatment would be efficacious, such in cases of infections (e.g. bacterial, viral, fungal and parasitic), epilepsy, schizophrenia, cancer, parkinson's disease, Alzheimer's disease, asthma, diabetes, hypertension, polycystic kidney disease, arthritis, and inflammacry bowel disease. The present sequence represents a rat liver dispeptidyl peptidase IV (DPP4), which is used in example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
